

Dissolve Skin Discoloration Effectively and For Good

Hydroquinone-free. Medical grade.
Safe for all skin types

A long-term topical skin care solution that addresses skin hyperpigmentation has been long sought after by physicians and dermatology patients. Specifically, patients wish to achieve improved visible skin tone that is more evenly pigmented, with reduction in the appearance of hyperpigmented 'spots' (age or sunspots). Traditional depigmenting agents, such as hydroquinone and strong acids, raise several safety concerns with long term exposure, with instances of worsening hyperpigmentation as skin is further traumatized with usage.

The Professional Pigment Solution uses two revolutionary technologies and other proven clarifying solutions to provide a safe and long-term treatment for skin discoloration. It works effectively on its own and as a daily complementary treatment to clinical pigmentation procedures.

PIGMENT SOLUTION

CALECIM®
PROFESSIONAL

Years of Research Two Novel Ingredients Several Proven Technologies To treat the toughest skin discoloration problems

The Professional Pigment Solution aims to address the hyperpigmentation and melasma problem by

- Understanding the process of hyperpigmentation and strengthening the skin's reaction to inflammation that is the key cause of skin discoloration
Interleukin-10, TGF-Beta 1 (found in Cord Lining Conditioned Media), Tranexamic Acid
- Improving the body's repair mechanisms; an inefficient repair response by the skin results in melanin being deposited in the epidermal layers. These proteins found in our proprietary CALECIM® boosts the skin's ability to repair itself.
VEGF, Fibroblast Growth Factors (found in Cord Lining Conditioned Media)
- Accelerating the body's natural autophagy, which is a process of degrading and ridding itself of unwanted tissue like melanin
Aa-(Clear)² derived from plant extract Arisaema Amuerense, Lenoleic acid
- Inhibiting Tyrosinase, the copper-colored enzyme that catalyzes production of melanin
4-n-butylresorcinol, Glutathione, Alpha-arbutin
- Obstructs melanin transfer and reduces free radical oxidation
Niacinamide, Sodium Ascorbyl Phosphate

This combination of technologies offers the potential to provide a long-term solution that treats the entire process of hyperpigmentation and melasma. The treatment begins not only after reactive hyper-melanosis takes place, but well before. Not only does it target the inflammatory stages, it also builds the skin's resilience to environmental stimuli so that skin disruption and reactivity are reduced, resulting in decreased occurrence of hyperpigmentation.

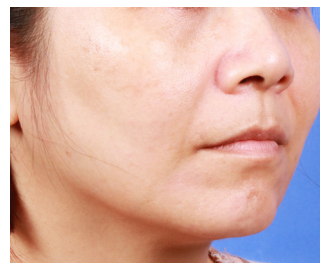

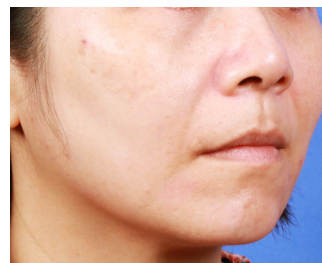

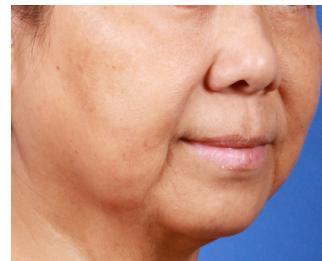

Clinical Observations: Visible lightening of stubborn skin discoloration and chronic erythema, with overall improved regulation of skin tone

Visible effects are observed after 35 days
With optimal results in 90 days

Revolutionary Technology For Skin Discoloration

Create an advanced home care regimen to achieve and maintain clear, radiant skin

PROFESSIONAL PIGMENT SOLUTION

- Contains two novel ingredients, the first of its kind in a de-pigmenting treatment
- Utilizes proven technologies that inhibit the melasma-forming process
- Can be used by all skin types, tolerates long term usage, and supports clinical discoloration procedures
- Apply AM and PM to affected areas before application of moisturizers
- Apply sunblock liberally AM, and re-apply every 3 hours when in direct contact to sunlight or water

RESTORATIVE HYDRATION CREAM

- Supports discoloration treatments by optimizing skin's hydration levels
- Smoothens skin texture and promotes skin's natural radiance
- Hydrates every level of skin with stem-cell derived Hyaluronic Acid
- Apply AM and PM, after Professional Pigment Solution, to all facial regions, pass the jawline

All CALECIM® Professional products are available exclusively at medical clinics
